

## ABSTRACT

An automatically data delivering system including a server and a mobile communication device is disclosed. The server stores a plurality of pieces of data, from which a piece of data is selected in response to a data request received from  
5 the mobile communication device. The selected piece of data is transmitted back to the mobile communication device. The mobile communication device transmits the data request to the server depending on a user-designated time condition. When the selected piece of data is downloaded from the server, the  
10 downloaded piece of data is stored in the memory and is reproduced by a display and a speaker.
